Received 23 February 2017
Accepted 23 February 2017

Abstract

Purpose – The purpose of this paper is to improve the understanding of the integration of business process management (BPM), business process re-engineering (BPR) and business process innovation (BPI) with big data. It focusses on synthesizing research published in the period 2006-2016 to establish both what the authors know and do not know about this topic, identifying areas for future research.
Design/methodology/approach – The research is based on a review of 49 published papers on big data, BPM, BPR and BPI in the top journals in the field 2006-2016.
Findings – In this paper, the authors have identified the most influential works based on citations and PageRank methods. Through network analysis the authors identify four major clusters that provide potential opportunities for future investigation.
Practical implications – It is important for practitioners to be aware of the benefits of big data, BPM, BPR and BPI integration. This paper provides valuable insights for practitioners.
Originality/value – This paper is based on a comprehensive literature review, which gives big data researchers the opportunity to understand business processes in depth. In addition, highlighting many gaps in the current literature and developing an agenda for future research, will save time and effort for readers looking to research topics within big data and business processes.

Keywords Research methodology, Network analysis, Bibliometric analysis, Big data analytics
Paper type Literature review

1. Introduction

The area of big data has received increasing attention from both the academic and the business communities over the past few decades. It helps to gain business insights, competitive advantage and transforms entire business processes (Wong, 2012; Oh *et al.*, 2012; Mishra, Gunasekaran, Papadopoulos and Childe, 2016). It can "create significant value for the world economy", which "enhances the productivity and competitiveness of companies and the public sector and creates a substantial economic surplus for consumers" (Manyika *et al.*, 2011, p. 1). Several objectives can be fulfilled by analysing big data, so there is a need for analytical techniques (big data analytics or BDA) to deal with large and complex data sets. Some organizations view BDA as a tool that can help in making strategic decisions, while scholars use it as a basis for verifying existing models and theories (Muhtaroglu *et al.*, 2013). Organizations can empower their customers and improve decisions if they harness the power of BDA effectively (Miller, 2013). By recognizing BDA's potential, organizations improve the efficiency and quality of their business processes through effective business process management (BPM). BPM not only improves processes but also monitors the technological advances that can be integrated in the development of efficient processes through business process re-engineering (BPR) and business process innovation (BPI) (Anand *et al.*, 2013). Thus, the successful integration of BDA and business processes may create a "new class of economic asset" and help the top-performing organizations redefine their business and outperform their competitors.

A number of literature reviews on big data have been completed in the past few years (Sagiroglu and Sinanc, 2013; Fosso Wamba *et al.*, 2015; Gandomi and Haider, 2015;

Business Process Management Journal
Vol. 23 No. 3, 2017
pp. 1-16

1463-7154
DOI 10.1108/BPMJ-02-2017-0047

Amiri Khorheh *et al.*, 2015; Wang *et al.*, 2016; Mishra, Gunasekaran, Papadopoulos and Childe, 2016). Anand *et al.* (2013) reviewed the literature on BPM, BPR and BPI. Nevertheless, there has been no effort to review the integration of big data and BPM, BPR and BPI, using rigorous bibliometric tools to make them useful for researchers and practitioners. There is therefore a need to synthesize the evidence about the usefulness of existing studies.

Motivated by this lack, our main objective with this study is to introduce the idea of using a bibliometric and network analysis technique to explore the world of big data and business process. We aim to: systematically and rigorously collect and analyse existing studies in this field to identify the top contributing authors, countries, affiliations and key research topics; and use network analysis to reveal future research gaps that can be pursued by the big data research community. We performed this analysis using the guidelines proposed by Fahimnia *et al.* (2015). A bibliometric and network analysis is a powerful tool for identifying established and emerging topical areas. This review collects and analyses 49 articles on big data and business processes published from January 2006 to October 2016. We believe that this review will be valuable for researchers who want to identify areas that have been thoroughly researched or where research is lacking, and for practitioners who want to stay up to date about the state of research and big data and business processes.

The paper is structured as follows. Section 2 outlines our research methodology, including protocol development, study selection, data extraction and analysis. Sections 3 and 4 report the results of the bibliometric and network analysis. Our findings, limitations and directions for future research are discussed in Section 5.

2. Methodology

This study is a bibliometric and network analysis review, that is, we document all the available studies relevant to a current area or a specific research question (Fahimnia *et al.*, 2015). We determined on this methodology for a number of reasons: to identify the top contributing authors, organizations and countries related to the field; to compare citation and PageRank analysis; and to uncover current research gaps through data clustering. To achieve our research objectives, we took a five-step approach, outlined in detail below: develop a review protocol; identify inclusion and exclusion criteria; explain the search strategy process; study the selection process; and use data extraction and analysis.

2.1 Review protocol

Our search began with the development of a comprehensive review protocol based on the guiding principles and procedures of the bibliometric and network analysis review. This protocol identifies the search strategy, research objectives, data extraction, criteria for article selection and data analysis.

2.2 Inclusion and exclusion criteria

To achieve our objectives, we set up inclusion and exclusion criteria so that the most relevant articles were extracted from the database. We considered research articles from peer-reviewed journals in the English language, published from January 2000 to October 2016 in the Web of Science (WoS) database. We eliminated conferences, workshops, editorials, meetings, notes and tutorial summaries and considered articles only related to big data and business processes.

2.3 Search strategy

We chose the WoS database as it is one of the largest bibliographic databases, providing access to articles published since 1970 and covering approximately 8,500 high-impact

research journals. We searched for specific keywords derived from our research objectives and the structure of this review to identify relevant articles. We searched in titles, abstracts and keywords of articles in the WoS database for "BPM", "BPR", "BPI", "big data", "business analytics" and "big data analytics". The initial search resulted in 1,078 articles. The results were then saved in plain text format and contained basic information about the paper, such as title, authors' names and affiliations, abstracts, keywords and references.

2.4 Study selection process

Of the 1,078 studies selected, 253 were duplicates and were removed using Endnote. To fulfil the objective of our study, we restricted our search to titles, abstracts, keywords and peer-reviewed journals (excluding grey literature – workshops, conference papers, notes, editorials, meetings, etc.). This elimination process resulted in 486 relevant documents, published during the 11-year period 2006-2016. The next step in the selection process was to consider articles published in the top ten journals (i.e. the journals with the maximum papers in the field according to WoS). We found 49 articles. The distribution of the primary studies throughout the period is presented in Figure 1.

We restricted the period studied to 2006-2016 to facilitate graphical representation. The number of papers (nine) for 2016 was estimated up to October 2016. The figure demonstrates the changing behaviour of publications in each year. It shows that the number of publications on big data and business processes increased slowly from 2006 to 2012, with a dramatic rise in publications after that date. It is clear that interest in integrating big data with business processes has increased rapidly in the past four years.

2.4.1 Distribution of articles per journal. Table I, which details the number of articles related to big data integration with business processes by journal, shows that the most popular is *Decision Support Systems* with 13 articles (26.53 per cent), followed some distance behind by *Interfaces* and *Industrial Management Data Systems* (5; 10.20 per cent) and the *IBM Journal of Research and Development* (4; 8.16 per cent).

2.4.2 Classification of articles: approaches used most. The distribution of articles by approach used is presented in Table II. The vast majority of papers (14; 28.57 per cent) are experiments/model-based papers, followed by review papers (10; 20.41 per cent) and survey studies (9; 18.37 per cent). The results also indicate that there is a shortage of simulations (3; 6.12 per cent) and case studies (6; 12.24 per cent).

2.4.3 Classification of articles: research areas. Table III shows the classification of articles based on research areas. The largest number of published articles is in computer science (35; 71.43 per cent), followed by operations research (27; 55.10 per cent), engineering

Information science library science	2	4.082

Table III.
Research areas

(16; 32.65 per cent) and business economics (7; 14.29 per cent). The high proportion of articles in computer science is not a surprise as this research area is at the heart of the big data revolution and has provided tools to analyse massive amounts of data.

2.5 Data extraction and synthesis

In the data extraction and synthesis stage, we read all 49 studies carefully and extracted relevant data using Endnote and Excel spreadsheets. Our main objective was to obtain full and precise content records of all the primary studies. The data related to authors, keywords, ISSN, study title, publication date, location and affiliation; cited references were extracted from the WoS core collection. Once the data from the primary studies had been extracted and recorded, we performed the analysis using BibExcel and Gephi.

3. Bibliometric analysis

In this section, we provide statistics about the 49 shortlisted articles. Specifically, we studied these articles in terms of their authors, keywords, affiliations and funding agencies. We conducted bibliometric analysis using BibExcel as it is highly flexible and capable of dealing with large volumes of data; it is also compatible with other applications such as Excel, Pajek and Gephi (Persson *et al.*, 2009; Paloviita, 2009). An additional merit of BibExcel is that it generates data for future network analysis, which is not possible with other software like HistCite or Publish or Perish.

The data extracted from WoS in plain text format (containing all the necessary bibliographic information) was used as input into BibExcel. For the data analysis, the plain text format was reformatted to generate different file types, such as .net-file, .cit-file, .oux-file and .out-file.

3.1 Author influence

To analyse the influence of authors, we extracted the author field from the data file and recorded the frequency with which all authors appeared. Table IV presents a list of the top ten contributing authors and the number of publications they have authored or co-authored. As we can see Chae, with three publications, dominates the list, followed by seven others with two publications.

3.2 Keywords

The keywords and words used in the titles of papers were extracted from WoS plain text format in BibExcel, and the frequency of their occurrence was recorded. The top 20 words used in titles and most popular keywords are presented in Tables V and VI. From these tables,

Authors	Number of publications
Chae, B.	3
Zhao, J.L.	2
Trkman, P.	2
Sheu, C.	2
Olson, D.	2
Mccormack, K.	2
Liberatore, M.	2
De Oliveira, M.P.V	2
Zorrilla, M.	1
Zimbrao, G.	1

Table IV.
Top ten contributing authors

Big data	4	Internet	2

Table VI.
Top 20 keywords

we see a uniformity in the words used in titles and in lists of keywords. For instance, both tables include big data, analytics, performance and information systems. This demonstrates clearly that the most popular keywords are actually the search words we chose for this study.

3.3 Affiliation statistics

To understand the impact of affiliation on the number of publications, authors' affiliations were extracted from the WoS plain text file in BibExcel. The frequency with which these affiliations occurred was used to identify the top-performing organizations, shown in Table VII. The contribution of countries can also be identified in a similar way. Table VIII shows the top ten countries contributing to the field of big data. A comparison of Tables IV and VII reveal that top universities like Kansas State University and the University of Ljubljana are represented by

Affiliation	Number of publications
University of Nebraska	4
Kansas State University	4
University of Ljubljana	3
IBM Software Group	3
Villanova University	2
IBM Research Division	2
IBM Corporation	2
City University of Hong Kong	2
Vlerick Business School	1
Virgnia Polytechnic Institute	1

Table VII.
Top ten contributing organisations

Countries	Number of publications
USA	24
People's republic of China	9
UK	5
Germany	4
Taiwan	3
Slovenia	3
Canada	3
Brazil	3
Austria	2
Switzerland	1

Table VIII.
Top ten contributing countries

the top contributing authors Chae, B. and Trkman, P. Thus, it may be concluded that the performance of one or two researchers is sufficient to improve the ranking of an institute. We also notice that the majority of work has been carried out in USA, followed by People's Republic of China, while only a few studies have been done in Austria and Switzerland.

4. Network analysis

The literature records the use of various tools, such as Pajek, VOSviewer, HistCite Graph Maker, and Gephi, to perform network analysis. We chose Gephi for this study as it can handle various data formats and complex data sets and generate flexible, insightful visual aids. In Gephi, the published articles act as nodes and citations as arcs or edges. To generate graphs in Gephi, a .NET file is needed and can be created using BibExcel.

4.1 Citation analysis

Citation analysis examines the frequency with which an article is cited. The number of citations of a particular article reflects its importance in that area of research (Garfield, 1972). Thus, the importance of an article can be measured as high or low, depending on the number of citations it has received. This method helps the researchers to understand how the area of research has evolved over a period of time and which articles are the most popular (Pilkington and Meredith, 2009). Although citation analysis has been criticized, it is one of the most commonly used techniques for analyzing the literature (MacRoberts and MacRoberts, 2010).

Figure 2 shows the ten most influential works published between 2006 and 2016. The top score, 45 citations, is Trkman *et al.* (2010). These authors investigated the relationship between analytical capabilities and performance in the planning, sourcing, manufacturing and delivery areas of the supply chain using information system support and business process orientation as moderators. Another important contribution was made by Abrahams *et al.* (2012) who used a text mining technique to analyse popular online discussion forums used by motor vehicle enthusiasts. This work received 28 citations, which reflects the significance of the article in this field. The article by Jararweh *et al.* (2014), which has been cited 16 times, introduced a modelling and simulation environment for cloud computing known as CloudExp and integrated it with the MapReduce processing model to handle the processing of big data.

4.2 PageRank analysis

Although citation analysis is commonly used to measure the popularity of an article, Ding *et al.* (2009) claimed that it should not be the only criterion of an article's significance. Prestige, which

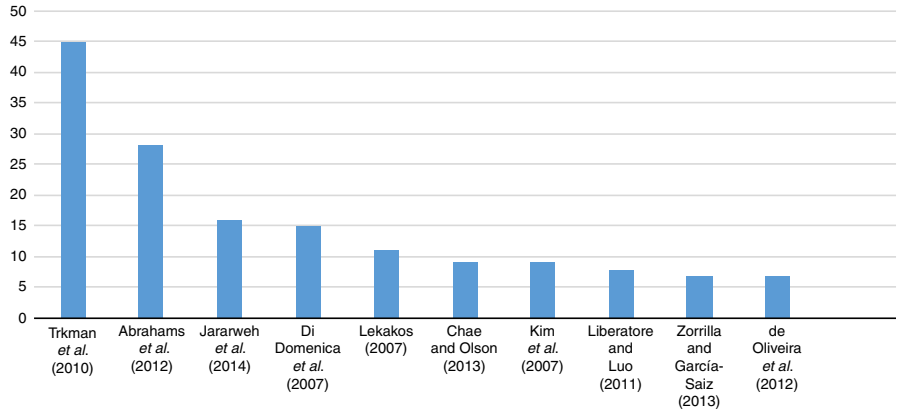

Figure 2.
Top ten cited articles: frequency

records the number of times an article has been cited by other highly cited articles, is another important criterion. To account for both popularity and prestige, Brin and Page (1998) introduced PageRank, which is an excellent way to prioritize the results of web keyword searches (Mishra, Gunasekaran, Papadopoulos and Childe, 2016; Mishra, Gunasekaran, Childe, Papadopoulos, Dubey and Wamba, 2016). There may be situations where these two measures are positively correlated, but it is not essential for a highly cited article to be a prestigious article as well. If we compare Figure 2 and Table IX, Trkman *et al.* (2010) has shifted to fourth position in the list of top ten PageRank papers, which is dominated by LaValle *et al.* (2011), while none of the other articles in Figure 2 appears anywhere in Table IX.

4.3 Co-citation analysis

Through co-citation analysis, we can examine the relationship between groups of authors, topics, journals or keywords and explain how they are related to each other. Co-citation analysis can be based on authors or publications; author-based co-citation analysis helps depict social structure while publication-based co-citation analysis helps explain the intellectual structure of research field (Chen *et al.*, 2010).

In this study, we used Gephi to perform co-citation analysis. When the .NET file for 49 articles is opened for the first time in Gephi, a random graph with no clear pattern is generated. To provide visibility in the graph, we used Gephi's ForceAtlas layout, in which strongly connected nodes move to the centre of the network while less connected nodes move to its boundaries (Bastian *et al.*, 2009). This means that co-cited articles remain connected together while articles that are rarely co-cited are distanced from them. The nodes or "outliers" isolated from the network are excluded for the purpose of data clustering, which is explained in the following section.

4.3.1 Data clustering. The data clustering method helps to group articles in different clusters (Radicchi *et al.*, 2004; Mishra, Gunasekaran, Papadopoulos and Childe, 2016; Mishra, Gunasekaran, Childe, Papadopoulos, Dubey and Wamba, 2016) that has been used in literature for classifying given set of publications and also termed as modularity. The edges between the nodes in the same cluster are denser than those in different clusters. This density can be measured through modularity, an in-built tool in Gephi based on Louvain algorithm. The value of the modularity index lies in between −1 and +1 that measures the density of links inside communities vs the links between communities (Fahimnia *et al.*, 2015). Using this algorithm, we created four major clusters and found the modularity index to be 0.49 (see Figure 3). This value indicates strong relationship between the nodes within each cluster and yet a relatively strong relationship between the nodes of different clusters.

According to Hjørland (2013), if two or more articles are cited together, they are more likely to share a similar area of interest. Therefore, we performed a detailed analysis of the

Table IX. PageRank's top ten articles

Article	PageRank
Lavalle *et al.* (2011)	0.012076
Davenport and Harris (2007)	0.011495
Chen *et al.* (2012)	0.010823
Trkman *et al.* (2010)	0.009516
Manyika *et al.* (2011)	0.008468
Bharadwaj (2000)	0.008252
Pfeffer and Sutton (2006)	0.007304
Barney (1991)	0.006890
Adomavicius and Tuzhilin (2005)	0.006674
Feng *et al.* (2008)	0.006359

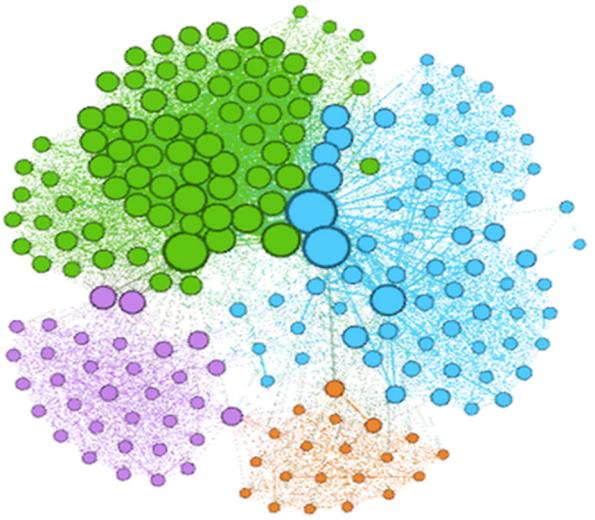

Figure 3.
Four major clusters

papers within each cluster to identify their research area. In Table X, we record the top publications based on their PageRank co-citation.

The classification in Table X reveals that the articles in cluster 1 mainly focus on conceptual and theoretical studies of big data. They highlight the need for analytical tools to deal with the massive amount of data that is being generated through recent developments in technology. These works also inspired organizations to use analytical decisions for business problem-solving and competitive advantage. Motivated by the works in cluster 1, researchers in cluster 2 identify the role of business analytics in managing and solving supply chain-related problems. The majority of the articles in this cluster are empirical and

Najafi *et al.* (2013)	Rai and Allada (2003)

Table X.
Top ten papers in each cluster (PageRank co-citation measure)

focus on the techniques that help to improve supply chain performance. Cluster 3 mainly concentrates on developing methods and models that would be beneficial while dealing with forecasting problems, while researchers in cluster 4 focus on recent advances and trends in the big data environment. The first two clusters are the more popular, while there is a scope for future work in clusters 3 and 4. This four-cluster classification provides a reliable guide for scholars looking for current research topics and future research opportunities.

5. Discussion and conclusions

In this study, we present an overview of the distribution of publications on big data and business processes by conducting a bibliometric and network analysis review of articles written during the period 2006-2016. To extract relevant studies, we searched for papers in the WoS database using predefined keywords. We screened papers by analysing their titles and abstracts and removed those that violated the inclusion criteria. To provide an overview of big data and business process status, we identified a primary set of 49 articles. The results of our study identify the key contributing authors, countries, affiliations and keywords across a broad spectrum of disciplines.

We can see from the bibliometric results that a large majority of the 49 primary studies were carried out in USA (approximately 50 per cent), while only 2-4 per cent were done in Switzerland and Austria. We therefore recommend that these countries should put more research effort into improving their business processes by recognizing the potential of big data. Our findings also note that relatively low number of publications have appeared in this field. From Figure 1 we can see a rapid increase in publication numbers in the field of big data and business processes since 2012. This clearly demonstrates a growing interest in this area, which is unsurprising for a relatively new concept.

Reviewing and summarising what we know in relation to big data, business processes and how organizations integrate them to their advantage, we believe that this study will be beneficial for a wide range of researchers and practitioners. Our findings may help researchers to identify new research questions, gain an overview of current research and position and align their own work. Our study also helps practitioners to understand the practical challenges when integrating big data with business processes. Young scholars may use these findings as a guide to where to locate and publish different types of related research and gain further insights into the emerging field of big data.

5.1 Limitations and directions for further research

The literature review conducted in this paper has several limitations. Even though we adopted an established methodology, it could have limited the results as it focussed only on articles that appeared in peer-reviewed academic journals published in English. This may have led to the exclusion of potentially relevant articles from the sample. We took care to include all past studies by consulting the WoS database but the selection process we used may have omitted some relevant research papers. Furthermore, we omitted a search for grey literature – this may provide material for further insights. Overall, this review provides a perspective on the state of big data research today.
